China has prioritized the development of “green” (or environmentally friendly) hospitals. Based on the latest Chinese national hospital construction and retrofit strategy, China will support green hospitals across the country and at the local level. In Tianjin specifically, there are more than 380 hospitals, all of which are positioned for green design and transformation.

Building off the success of the December 2016 U.S. – China SCCP workshop on green hospitals, this workshop will focus on specific opportunities for U.S. – China commercial cooperation in Tianjin. The one-day workshop will feature presentations from U.S. companies on relevant U.S. technologies, including for air conditioning and ventilation, wastewater treatment, elevators, lab equipment, big data and smart operations, among others. Relevant standards will be covered as well, since China is working on implementing new national evaluation standards for green hospitals.
